I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh; references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 08459 500505.
- Write your answers in capital letters using black ink or you may type them.
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- Once you have filled in the form you must remember to sign and date it.
- For details of the fee and ways to pay please contact the Patent Office.

DUPLICATE

EXPANDABLE CONNECTION

FIELD OF THE INVENTION

This invention relates to an expandable coupling, and in particular to an expandable threaded coupling for connecting expandable tubulars.

BACKGROUND OF THE INVENTION

5 The gas and oil exploration and production industry has recently begun to employ expandable downhole tubulars, for example in the form of diametrically expandable casing, liner and sand screens. A number of expansion methods have been proposed, including the use of rotary expansion tools
10 and devices. The present applicant has developed a range of rotary expansion tools which feature rollers mounted on a body. Such a tool is rotated within the tubular to be expanded, with the rollers in rolling contact with the inner wall of the tubular. The rollers are arranged to
15 reduce the wall thickness of the tubular by cold work, with a corresponding increase in the tubular diameter.

The majority of downhole tubular strings comprise a number of threaded sections which are coupled together at surface to a desired torque. Typically, each section will
20 feature a leading threaded male portion, or pin, and a threaded female portion, or box, on the other end such that

a coupling between two adjacent sections features a threaded pin extending into a corresponding threaded box. Such couplings tend to operate satisfactorily on conventional applications, where the coupling is not subject to expansion. However, expansion of tubular strings including such couplings is problematic. One difficulty that may be encountered is that if a string of tubulars is expanded, for example by using a rotary expansion tool or a cone expansion tool or the like, the torque held in the couplings is released. Furthermore, where expansion is achieved using a rotary expansion tool, the tool applies a torque to the tubulars, such that in certain circumstances it is possible for rotary expansion of a coupling to result in backing-off of a threaded coupling, and thus compromise the integrity of the coupling, or even lead to separation of the coupling, and loss of the string below the coupling.

This has been addressed by ensuring that the thread configuration is compatible with the direction of rotation of the rotary expansion tool, such that the tool tends to tighten or torque-up the coupling as the tool passes into the lower tubular section which carries the box. However, the applicant has found that this tightening or torquing-up of couplings can, in certain circumstances, lead to other difficulties.

SUMMARY OF THE INVENTION

According to the present invention there is provided an expandable tubular coupling comprising:

a threaded male portion; and

5 a corresponding threaded female portion,

the threaded portions featuring thread profiles configured such that the coupling may be made up to a predetermined extent, and once made up to said predetermined extent may be made up no further.

10 The present invention thus differs from existing threaded couplings which may feature torque shoulders, or other arrangements, which limit the degree to which the coupling can be made up. In existing arrangements, following expansion of the coupling, it is often possible, and indeed it may sometimes be desirable, to make the coupling up further. This may not create any problems if the tubular string is free to rotate below the expansion tool. However, if a lower part of the string is held against rotation, for example by differential sticking, the 15 rotation of a tubular section and the further making up of a coupling in an upper part of a string in a top-down rotary expansion may result in a corresponding degree of backing-off of a coupling in a lower part of the string. Even where there is only a limited degree of making-up at 20 each coupling, for example one quarter of a turn, the rotation is cumulative as the string of tubular sections is 25

expanded, such that the integrity of one or more lower couplings may be seriously compromised, or indeed a coupling may separate, with the loss of the string below the coupling.

5 By configuring the thread profiles of the coupling of the present invention to prevent the coupling from being made up further, this difficulty is avoided.

The thread profiles may take any appropriate form, and preferably each thread portion comprises first and second parts having different thread profiles. Each thread portion may have a leading part and a trailing part, when made-up the leading part of the male portion engaging the trailing part of the female portion, and the leading part of the female portion engaging the trailing part of the male portion. Most preferably, the male portion has a leading part with a thread profile corresponding to the thread profile of the trailing part of the female portion, and a trailing part with a thread profile corresponding to the thread profile of the leading part of the female portion, and the thread profiles are configured such that the thread portions may be made up until the start of the thread profile on the trailing part of the male portion encounters the start of the different thread profile on the trailing part of the female portion. The change in thread profiles between the first and second parts may be abrupt, but is preferably gradual or incremental.

Conveniently, the thread profiles may be a combination of a square thread profile and a dovetail thread profile. This allows each thread portion to be cut initially as a square thread, and then the flanks of a selected part of each thread portion to be cut with an angled cutting insert to create a dovetail profile. As such a coupling is being made up, the square profile cut in the leading part of the male portion will mate with and pass through the dovetail profile cut in the leading part of the female portion and of course will continue to pass through and mate with the square portion cut in the trailing part of the female position. However, the dovetail profile cut in the trailing part of the male portion will not mate with the square profile of the trailing part of the female portion, preventing any further rotation of the thread portions when different thread profiles meet, before or after expansion of the coupling.

Alternatively, the thread profiles may be a combination of similar form but different dimensioned thread profiles such as square thread profiles or dovetail profiles. With this arrangement a smaller thread profile is preferably located on the leading part of the male portion and is adapted to mate with a similarly dimensioned thread profile located on the trailing part of the female portion. Conveniently, a larger dimensioned thread profile is located on trailing and leading parts of the male and

female portions respectively, which larger dimensioned thread profiles are engageable with each other but are not engageable with the smaller thread profiles, preventing any further rotation of the thread portions after the coupling has been made-up, before or after expansion of the coupling. The interface between the different dimensioned thread profiles may be abrupt or alternatively gradual or incremental.

The thread profiles may be parallel or tapered, left hand or right hand.

According to a second aspect of the present invention, there is provided a method of coupling tubulars, said method comprising the steps of:

providing a first tubular having a threaded male portion and a second tubular having a corresponding threaded female portion, wherein the threaded portions feature thread profiles configured such that the threaded portions may be made up to a predetermined extent, and once made up to said predetermined extent may be made up no further; and

engaging the male and female threaded portions to form a tubular coupling made up to said predetermined extent.

The coupled tubulars may subsequently be expanded.

BRIEF DESCRIPTION OF THE DRAWINGS

These and other aspects of the present invention will now be described, by way of example only, with reference to the accompanying drawings, in which:

5 Figure 1 is a cross-sectional view of a casing string being expanded in a borehole by a rotary expansion tool;

Figure 2 is a schematic part sectional view of an expandable tubular coupling in accordance with an embodiment of the present invention;

10 Figure 3 is an enlarged sectional view of area 3 of the expandable tubular coupling of Figure 2 showing the coupling engaged; and

Figures 4 and 5 show part sectional views of a box connection used in the coupling of Figure 2 in various stages of a thread forming process.

15 DETAILED DESCRIPTION OF THE DRAWINGS

Reference is first made to Figure 1 in which there is shown a cross-sectional view of a casing string 10 located in a bore 12 and being expanded, top-down, using a rotary expansion tool 14 (shown in broken outline). The casing string is composed of a number of casing tubular sections 16, connected together by use of threaded couplings 18, which in the embodiment shown are left handed threaded couplings. Although not apparent from Figure 1, the threaded couplings are formed by engagement of a male threaded portion, or a pin connection, with a female

threaded portion, or box connection. The pin connections are orientated in a downwards direction with respect to the bore 12, and the box connections are located in an upwards direction with respect to the bore 12. The engagement of the pin and box connections will be discussed in more detail hereinafter with reference to Figure 2. However, for the meantime reference is still made to Figure 1.

During top-down rotary expansion with the expansion tool 14 being rotated in a clockwise direction when viewed from above the tool 14; as indicated by arrows 20, the force exerted on the casing string 10 by the tool 14 will act to rotate the casing string 10 in a clockwise direction. When the tool 14 advances beyond a coupling 18 which has been expanded, the induced rotation of the casing 10 will act to further tighten or make-up the expanded coupling due to the fact that the casing tubulars located above the expanded coupling are rotatably fixed at the surface or head of the bore 12, and that the coupling 18 is a left handed coupling.

It should be noted that rotation may not create any problems if the casing string 10 is free to rotate below the expansion tool 14. However, if the string 10 is held against rotation at a lower portion 22 thereof, for example by differential sticking, the rotation of an upper tubular section 16 and the further making-up of an adjacent expanded coupling 18 may result in a corresponding backing-

off of a coupling 18 in a lower part of the string 10. Even where there is only limited rotation at each coupling 18 following expansion, for example one quarter of a turn, the rotation is cumulative as the casing string 10 is expanded, such that the integrity of one or more lower couplings 18 may be seriously compromised, or indeed the degree of rotation may be sufficient to lead to separation of a coupling 18, and loss of the string 10 below that coupling 18.

Reference is now made to Figure 2 in which there is shown a part sectional view of an expandable coupling 23 in accordance with an embodiment of the present invention, which coupling 23 is composed of the ends 24, 26 of two casing tubulars 16, wherein the end 24 of the upper tubular 16 includes a threaded pin connection 28, and the end 26 of the lower tubular 16 includes a threaded box connection 30. For clarity, the pin and box connections 28, 30 are shown separated.

The pin and box connections 28, 30 each include first and second threaded parts featuring different thread profiles. In the embodiment shown, the leading part of the box connection 30 features a dovetail thread profile 32 which corresponds to a dovetail thread profile 34 on a trailing part of the pin connection 28. Additionally, the trailing part of the box connection 30 features a square thread profile 36 which corresponds to a square thread

profile 38 on a leading part of the pin connection 28.

To make up the coupling 23, the lower tubular carrying the box connection 30 is held stationary while the upper tubular carrying pin connection 28 is rotated relative thereto. The arrangement is such that the square thread profile 38 of the pin connection 28 can mate with both the dovetail thread profile 32 and the square thread profile 36 of the box connection 30, whereas the dovetail thread profile 34 of the pin connection 28 can only mate with the dovetail thread profile 32 of the box connection 30. Thus, the coupling 23 can only be made-up to the extent where the interface 40 between the different thread profiles 34, 38 of the pin connection 28 engage or abut the interface 42 between the different thread profiles 32, 36 of the box connection 30. Once the interfaces 40, 42 engage, no further tightening of the coupling 23 is possible. Thus, during top-down rotary expansion, that is, expansion in the direction of arrow 44, the reaction forces between the casing 10 and the rotary tool 14 (Figure 1) will not further tighten or make-up the coupling 23, eliminating or at least reducing the possibility of loosening lower couplings, as discussed above.

The coupling 23 will now be described further with reference to Figure 3, in which there is shown a cross-sectional view of a portion of the coupling 23 of Figure 2 in the region of the thread profile interfaces 40, 42. As

shown, the leading portion of the pin connection 28 features a square thread profile 38 and the trailing portion a dovetail thread profile 34. Also, the leading portion of the box connection 30 features a dovetail thread profile 32 and the trailing portion includes a square thread profile 36. It is apparent from Figure 3 that the dovetail thread profile 34 of the pin connection 28 will not mate with the square thread profile 36 of the box connection 30, and similarly, the dovetail thread profile 32 of the box connection 30 will not mate with the square thread profile 38 of the pin connection 28. This arrangement thus prevents the coupling 23 being tightened beyond the interfaces 40, 42, generally identified as area 43 in Figure 3.

Reference is now made to Figures 4 and 5 in which there is shown a cross sectional view of a portion of a box connection 30 at various stages in a thread forming process. Referring initially to Figure 4, a square thread profile 46 is cut along the entire thread portion of the box connection 30 by conventional means, wherein the thread 46 includes flanks 48 which are disposed perpendicularly between respective roots 50 and crests 52a and 52b of the thread 46. The subsequent stage, shown in Figure 5, involves cutting the flanks 48 along the desired length of the box connection 30 to define new flanks 54 which are disposed at an acute angle with respect to the respective

roots and crests 50, 52b. This process therefore produces the required dovetail thread profile 32. In order for the coupling 23 to function as desired, the crests 52b of the dovetail thread profiles 32 are larger than those of the square thread profile 46. This will ensure that the dovetail thread profile 32 of the box connection 30 will not mate with the square thread profile 38 (Figure 3) of the pin connection 28 due to the incompatible configuration. Thus, the crests 52b of the square thread profile 46 shown in Figure 4, that is, those crests which will subsequently form the crests of the dovetail thread profile, are larger than the remaining crests 52a of the thread profile. To achieve this, the square thread profile 46 is cut with a variable crest length.

The thread portion of the pin connection 28 may be formed in the same manner as described above.

The flanks 54 of the dovetail thread profile 32 are individually cut using an angled cutting insert, which requires the cutting insert to be passed along the length of the dovetail thread portion 32 twice, once for each flank. This arrangement, however, requires that the cutting insert has a width substantially equal to or less than the roots 50 of the square thread profile to facilitate removal of the cutting insert without the requirement of withdrawing the cutting insert along the entire length of the dovetail thread profile 32.

It should be noted that the embodiments hereinbefore described are merely exemplary of the present invention and that various alterations may be made thereto without departing from the scope of the invention. For example, 5 the pin and box connections may be provided with thread portions having a similar form, differing only in their dimensions, such that a smaller male thread, for example, may mate with similar sized and larger female threads, but a larger sized male thread will be able to mate only with 10 a similar sized female thread but not a smaller female thread. Additionally, the interface between the different thread profiles may be gradual or incremental. For example, there may be a transition surface between the different thread profiles or a step defining a shoulder 15 between the thread profiles.

CLAIMS

1. An expandable tubular coupling comprising:
 - a threaded male portion; and
 - a corresponding threaded female portion,5 the threaded portions featuring thread profiles configured such that the coupling may be made up to a predetermined extent, and once made up to said predetermined extent may be made up no further.
- 10 2. An expandable tubular coupling as claimed in claim 1, wherein each thread portion comprises first and second parts having different thread profiles.
- 15 3. An expandable tubular coupling as claimed in claim 1 or 2, wherein the male portion has a leading part with a thread profile corresponding to the thread profile of a trailing part of the female portion.
- 20 4. An expandable tubular coupling as claimed in claim 1, 2 or 3, wherein the male portion has a trailing part with a thread profile corresponding to the thread profile of a leading part of the female portion.
5. An expandable tubular coupling as claimed in claim 4,

wherein the thread profiles are configured such that the thread portions may be made up until the start of the thread profile on the trailing part of the male portion encounters the start of the different thread profile on the trailing part of the female portion.

5

6. An expandable tubular coupling as claimed in claim 4 or 5, wherein the change in thread profiles between the first and second parts is abrupt.

10

7. An expandable tubular coupling as claimed in claim 4 or 5, wherein the change in thread profiles between the first and second parts is gradual.

8. An expandable tubular coupling as claimed in claim 4 or 5, wherein the change in thread profiles between the first and second parts is incremental.

15

9. An expandable tubular coupling as claimed in any preceding claim, wherein the thread profiles are a combination of a square thread profile and a dovetail thread profile.

20

10. An expandable tubular coupling as claimed in claim 9, wherein the square profile is provided on a leading part of the male portion and the dovetail profile is provided on a

trailing part of the male portion.

11. An expandable tubular coupling as claimed in claim 9 or 10, wherein the square profile is provided on a trailing part of the female portion and the dovetail profile is provided on a leading part of the female portion.

5

12. An expandable tubular coupling as claimed in claim 11, wherein the square profile on the leading part of the male portion is adapted to mate with the dovetail profile on the leading part of the female portion.

10

13. An expandable tubular coupling as claimed in claim 11 or 12, wherein the dovetail profile on the trailing part of the male portion is configured so as not to mate with the square profile on the trailing part of the female portion.

15

14. An expandable tubular coupling as claimed in any one of claims 1 to 8, wherein the thread profiles are a combination of similar form but differently dimensioned thread profiles.

15. An expandable tubular coupling as claimed in claim 14, wherein the thread profiles are square thread profiles.

20

16. An expandable tubular coupling as claimed in claim 14,

wherein the thread profiles are dovetail profiles.

17. An expandable tubular coupling as claimed in claim 14,
15 or 16, wherein a smaller thread profile is provided on
the leading part of the male portion and is adapted to mate
with a similarly dimensioned thread profile provided on the
trailing part of the female portion.

18. An expandable tubular coupling as claimed in any one
of claims 14 to 17, wherein a larger dimensioned thread
profile is provided on trailing and leading parts of the
male and female portions respectively, which larger
dimensioned thread profiles are engageable with each other
but are not engageable with smaller thread profiles
provided on the leading and trailing parts of the male and
female portions respectively.

19. An expandable tubular coupling as claimed in any one
of claims 14 to 18, wherein the interface between the
different dimensioned thread profiles is abrupt.

20. An expandable tubular coupling as claimed in any one
of claims 14 to 18, wherein the interface between the
different dimensioned thread profiles is gradual.

21. An expandable tubular coupling as claimed in any one

of claims 14 to 18, wherein the interface between the different dimensioned thread profiles is incremental.

22. An expandable tubular coupling as claimed in any preceding claim, wherein the thread profiles are parallel.

5 23. An expandable tubular coupling as claimed in any one of claims 1 to 21, wherein the thread profiles are tapered.

24. An expandable tubular coupling as claimed in any preceding claim, wherein the thread profiles are left hand.

10 25. An expandable tubular coupling as claimed in any one of claims 1 to 23, wherein the thread profiles are right hand.

26. A method of coupling tubulars, said method comprising the steps of:

providing a first tubular having a threaded male portion and a second tubular having a corresponding threaded female portion, wherein the threaded portions feature thread profiles configured such that the threaded portions may be made up to a predetermined extent, and once made up to said predetermined extent may be made up no further; and

engaging the male and female threaded portions to form

a tubular coupling made up to said predetermined extent.

27. The method of claim 26, further comprising locating
the coupled tubulars downhole.

28. The method of claim 26 or 27, further comprising
diametrically expanding the coupled tubulars.
5

29 The method of claim 28, wherein the coupled tubulars
are diametrically expanded by a rotary expansion tool.
